SCRIPT-CONTROLLED ACL – RESTRICT RECORD ACCESS BASED ON FIELD VALUE

PHASE 6: PROJECT TESTING PHASE

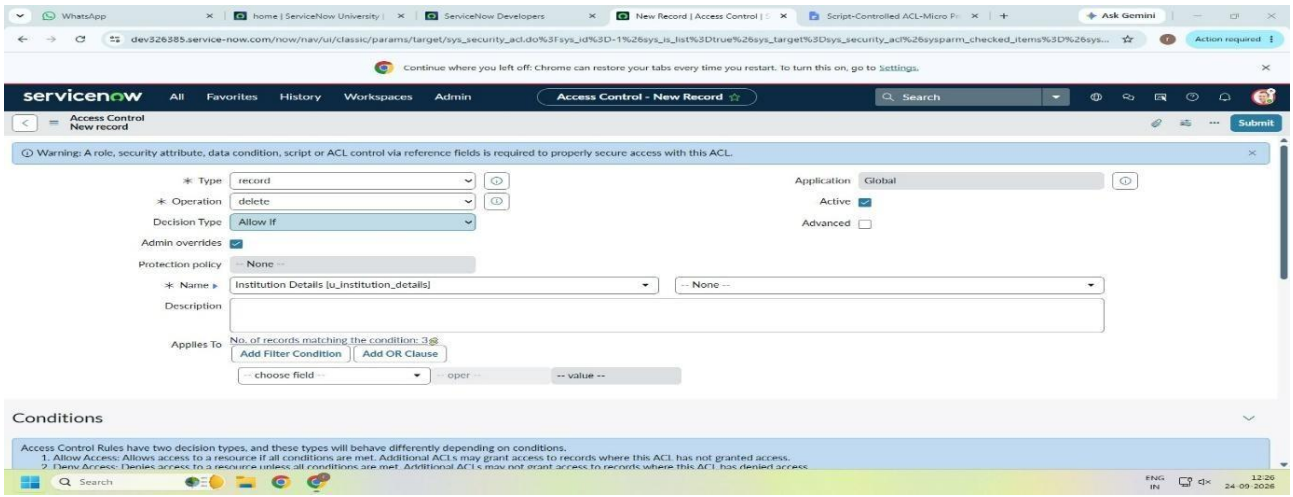

The Project Testing Phase focused on verifying the functionality of the implemented ACL in ServiceNow. The configured access rules and script logic were tested with different access conditions to ensure that records were properly allowed or restricted. The test results were checked to confirm that the ACL worked according to the project requirements.

The testing phase proves that the ACL behaves as designed. The rules were tried for the different operations and the visible records were compared with the expected results for each type of user.

6.1 Testing the ACL Configuration

The configured ACL was tested to verify whether the access rules were functioning correctly.

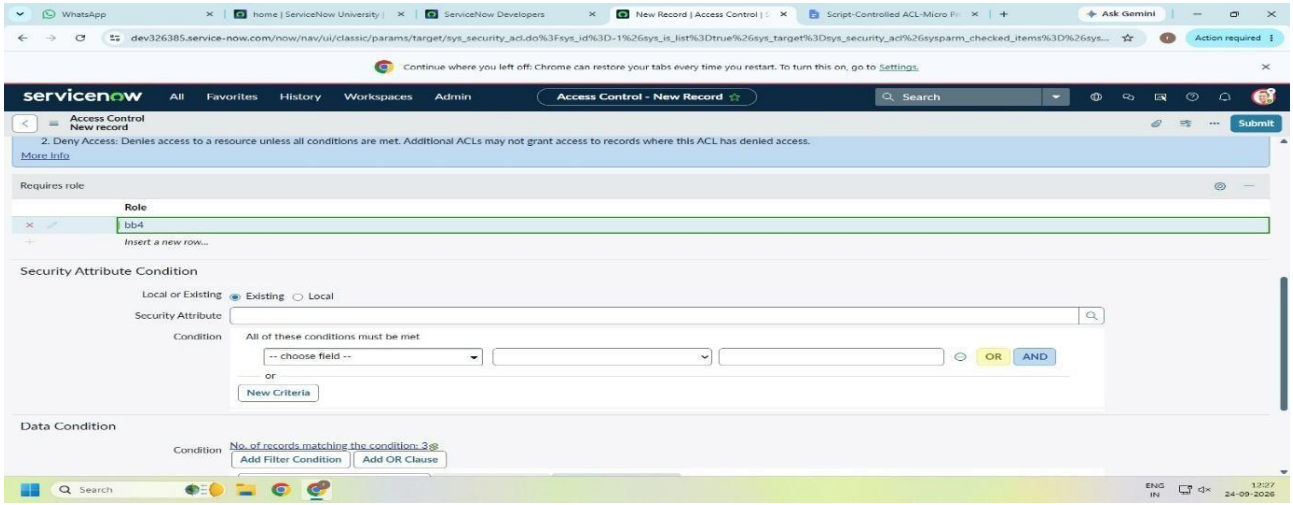

The ACLs were reviewed one by one for each operation. The screenshot shows the ACL for the **delete** operation on the Institution Details table, with the record type, the Allow If decision, the Admin overrides option and the Active option. Checking all four operations (read, create, write, delete) ensures that there is no gap through which a user could still modify or remove protected records.

6.2 Verifying User Access

User access to the selected records was checked based on the defined conditions.

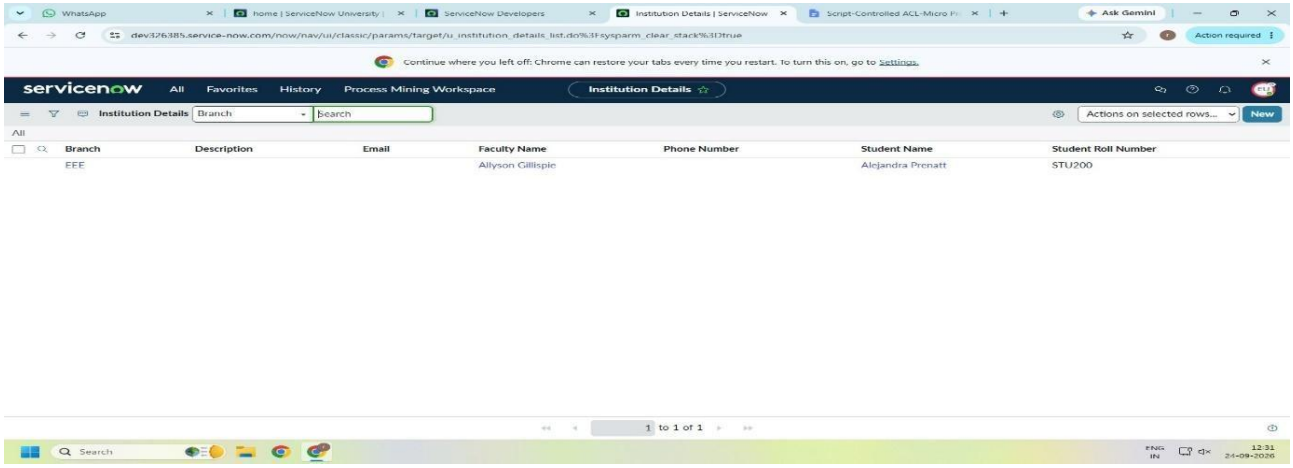

The Requires role section of the ACL was checked to confirm that the correct role was attached to the rule. This is the first thing to verify when a user reports that they cannot see a record: does the user really hold the role that the ACL requires? The Data Condition section below it was also checked to confirm that it refers to the Branch field.

6.3 Testing Access Restrictions

The access restrictions were tested to confirm that unauthorized access was properly prevented.

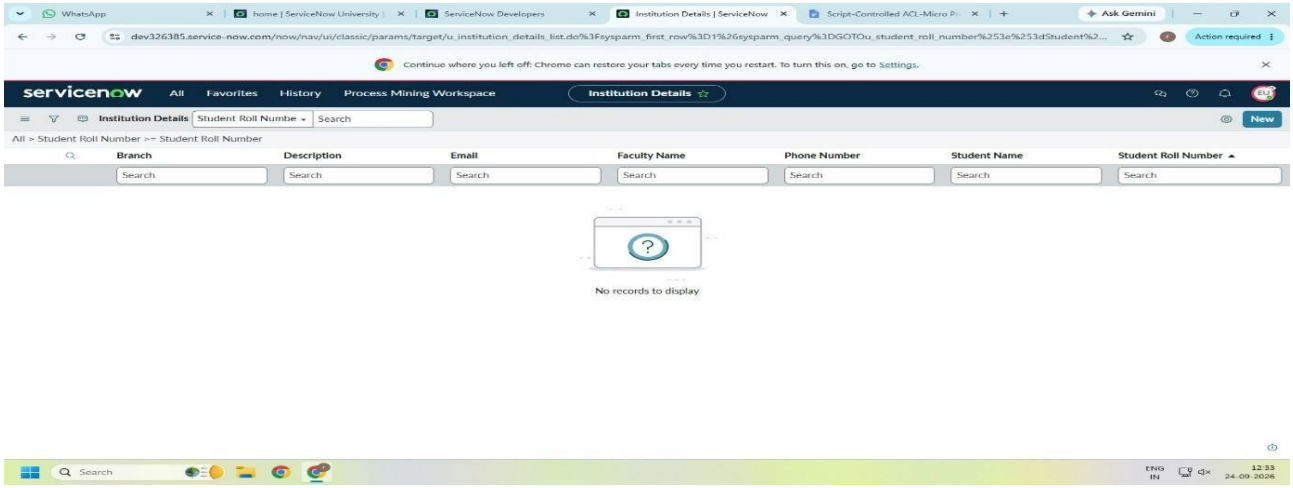

The Institution Details list was opened as a user who is allowed to see the EEE records. The list shows one record: Branch **EEE**, Faculty Name *Allyson Gillispie*, Student Name *Alejandra Prenatt* and Student Roll Number *STU200*. This confirms that an authorized user can see the record that satisfies the branch condition.

6.4 Verifying the Script Logic

The ACL script was tested to ensure that the defined conditions produced the expected access behavior.

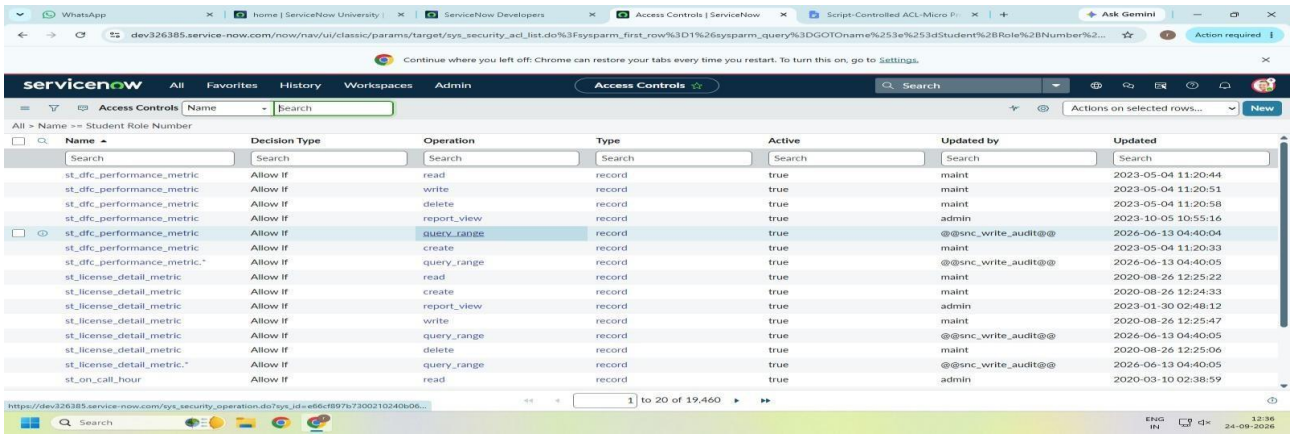

The list was then filtered by Student Roll Number and the result was **No records to display**. This shows the deny side of the script: when the user does not satisfy the conditions for a record, the script returns false and the record is hidden from the list, exactly as if it did not exist. This confirms that unauthorized users do not get any record.

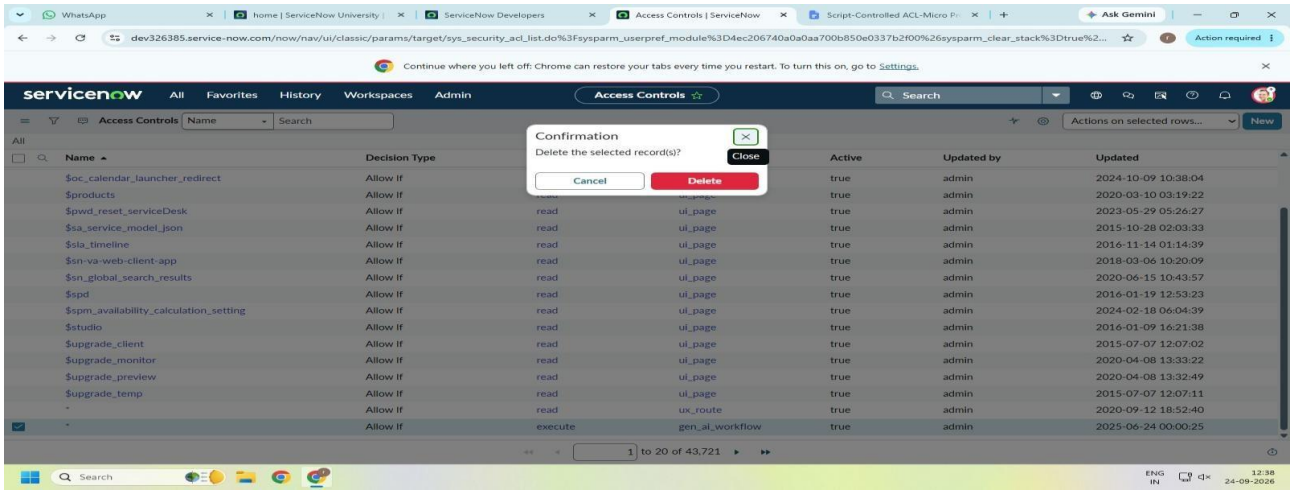

6.5 Confirming the Final Result

The final result was verified to confirm that the ACL worked according to the project requirements.

The results agree with the expected behavior written in Phase 2: administrators are not locked out, the authorized user sees the EEE record, and unauthorized access returns an empty result. The screenshots show the Access Controls list, which is used to verify that the rules exist and are active, and the confirmation dialog of the platform, which appears before a rule is deleted, and which shows why deletion of ACLs must be done carefully.
